ABSTRACT

The present study was undertaken in Anand Agricultural University of Gujarat state. For this study, 120 respondents were selected randomly. The data reveal that "own interest" was the prime motive behind writing the articles. However, the publication behaviour of the scientists was found to be low as more than two-third of the scientist had low level of publication behaviour. Further, it was found that except motives and attitude, all the variables included in the study were positively and significantly correlated with the publication behaviour.
