### ABSTRACT

Ageing is a gradual and steady process, which takes place over the entire life span of an organism and is generally defined as a process of deterioration in functional capacity of organism that occurs after maturity. Ageing is defined as "the detrimental changes with time during post maturational life that underline an increasing vulnerability to challenges there by decreasing the ability of the organism to service." Sex is a natural function, very beneficial in loving relationship. As people age, however, the relationship aspects of people sexuality often become a major important aspect of their sexual performance. Physical exercise specially kegel exercise improves and enhances sexuality. Regular yoga practice can have positive effects on sexual relationship.

**Key words :** Effect, Sexuality

As people age they often worry about their sexual performance. However, given good health and a willing partner, both men and women can enjoy sex for as long as they wish. Exercise is good for people – it keeps one's heart healthy and add years to people life. But exercise does not something else – it makes people's sex life better. By exercising several times a week, it not only be increasing people health but increasing the sex life also.

Yoga's view of sex is the same as of every other issue – moderation. Yoga considers sex to be a natural function, very beneficial in a loving relationship and, of course, essential for the continuation of the human race. This old age yoga practice is quite vary of other ancient religious practices for gaining elevated spiritual state. While most of the religious practices prefer ascertism and sexual abstinence as a way to uplift soul. Kundalini yoga considers carnal indulgence as a medium to increase self exploration. This practice of yoga lays great emphasis on leading a healthy sexual life. A big part of sex is feeling sexy. People who, exercise have an improved body image over people who do not exercise. Being more comfortable with body leads to better and more relaxed sex. A study showed that more physically fit men and women rated their own sexual desirability higher than less active men and women the same age.

### METHODOLOGY

The study was conducted in Kanpur district. Four zones were selected in this study. Area selected from four zones such as Civil lines, Shyam Nagar, Ratanlal Nagar, Kakadeo, Vishnupuri, Arya Nagar, Mall Road, Govind Nagar. Total sample size 160 were selected 80 male and 80 female. Dependent and independent variables

were used such as age, caste, religion, sexuality and yoga. The statistical tools were used weighted mean, percentage, chi-square test, correlation coefficient etc..

### RESULTS AND DISCUSSION

Table 1 indicates that distribution of old age persons as per religion more than 60.0 per cent respondents have belonged to Hindu family whereas 3.8 per cent respondents are Christian. 56.3 per cent male old age persons have belonged to Hindu family and 70.0 per cent female have in same religion. Minimum 1.2 per cent male persons have from Christian family and 6.2 per cent female from same category.

Religion	Male	Female	Total
Hindu	45 (56.3)	56 (70.0)	101 (63.1)
Muslim	21 (26.2)	16 (20.0)	37 (23.1)
Sikh	13 (16.3)	3 ( 3.8)	16 (10.0)
Christian	1 ( 1.2)	5 ( 6.2)	6 ( 3.8)
Total	80 (100.0)	80 (100.0)	160 (100.0)
<sup>2</sup>		3.510	P > 0.05

(Figures in parenthesis indicate percentage of respective values)

In Muslim, Christian and Sikh communities, non-veg and aphrodisiac foods have been taken from childhood due to which, if we see religion-wise sex desire is seen more in both men and women in these religions.

Table 2 indicates that distribution of old age persons according to physical exercise, 47.5 per cent male were doing walking and 32.5 per cent female were doing walking, whereas, 16.3 per cent male were not doing any exercise and 35.0 per cent female were not doing any
