# Comparative study of stomatal index of some folk herbal plants used in birth control 

Sheetal Shama Minz and Kunul Kandir

#### Abstract

The present investigation deals with the comparative study of stomatal index of some ethnomedicinal plants. Commonly the stomata are found on both surfaces of leaves. The most important function of stomata is gaseous exchange. The determination of stomatal index of ethnomedicinal plants like Lawsonia inerrnis, Moringa olifera, Bauhinia purpurea etc. are used in Birth Control.

$\underline{\text { Key words : Stomatal index, Stomata, Epidermal cell }}$

## INTRODUCTION

Stomata is a minute epidermal opening with a central pore and two kidney shaped cells containing chloroplast known as guard cells. The stomata are commonly found in the leaf surface. In upper surface of leaves, the number of stomata is less than lower surface.

The primary and most important functions of stomata is gaseous exchange and secondary function is transpiration. The distribution of stomata on upper and lower surface of leaves shows great variation.

After counting the stomata and epidermal cells, the stomatal index is determined. Stomatal index is the percentage of total numbers of stomata with total number of epidermal cells around the stomata in a unit area of leaf, it can be calculated by the following formula.

$$
\begin{array}{ll}
\text { S.I. } & =S / E+S \times 100 \\
\text { S.I. } & =\text { Stomatal index } \\
S & =\text { No. of stomata per unit area } \\
\mathrm{E} & =\text { No. of epidermal cells in the same area }
\end{array}
$$

## MATERIALS AND METHODS

Lawsonia inermis, Moringa oliefera, Bauhinia purpurea leaves were collected from Dipu Toly, Ranchi, in March - April 2010. These plants were identified with the help of Botany of Bihar and Orissa Vol. I, II and III ( Haines; 1921) which are maintained in the University Department of Botany, Ranchi University, Ranchi (Jain and Rao; 1978).

## RESULTS AND DISCUSSION

The findings of the study have been discussed in detail as under:

## Following plants were investigated :

The investigation of these plants showed that the stomatal index of Bauhinia purpurea was more and less in Moringa oliefera (Table 6 and Fig 1). Different parameters were used in this study. Many research work and have been done in this field. The medicinal plants of polygonaceae family have been studied by different scientists (Hammed et al., 2008). Stomatal frequency maturity and index on developing bracts of four abscisic acid mutant and wild type plants of Arabidopsis tholiana was also studied in different parts of country (Razem and Davis, 2002). The relationship of stomatal density and index was studied in different areas (Elwain et al., 1995). The

Fig. 1 : Graphical representation of stomatal index
types of stomata was also studied in different parts of the country (Cothem, 2008). The stomatal study of the plants are used in the classification of plants. The statistical analysis also play an important role in the field of taexonomy.

## Acknowledgment:

The authors are thankful to the Head of the University Department of Botany, Prof. H.B. Sahu, for providing necessary facilities and encouragement.
