Department of Extension Education, College of Agriculture, Marathwada Agricultural University, PARBHANI (M.S.) INDIA

ABSTRACT

The study was conducted in Parbhani district of Marathwada region of Maharashtra State. Parbhani and Purna talukas of Parbhani district were purposively selected for the present investigation because it has more area under okra crop. From each taluka five villages were selected based on maximum acreage under okra crop. From each village 12 respondents were selected randomly who were growing okra crop from last three years. Thus,120 respondents growing okra crop constituted the sample for study. The respondents were interviewed with the help of a well structured interview schedule. The findings revealed that majority (92.50 per cent) of the respondents adopted ridges and furrow method of irrigation. About 91.66 per cent and 86.66 per cent of the respondents had applied irrigations as per recommendation and applied protective irrigations, respectively. 90.00 per cent of them had adopted proper time of harvesting of okra crop, while 80.83 per cent of the respondents followed recommended climatic conditions for okra crop. Nearly 100.00 per cent of the respondents expressed that failure of electric supply was major constraint in adoption of cultivation practices of okra.

Key words : Adoption, Okra growers, Cultivation practices

INTRODUCTION

The basic challenge before India is to enhance the production of nutritious food in sustainable manner which besides feeding the country's large population, can play a major role in meeting the shortage of food. Vegetables being short duration crops, can give six to ten time more yield than any cereal crop in a year and thus, can provide better protection to the rising population. Vegetables are rich reservoir of vitamins and minerals, which are most essential for maintaining good health. All vitamins are found in small or bulk quantities in common vegetable crops. Their use in daily diet demands a large production in country like India.

Okra (*Abelmoschus esculentus* L.) is grown as an important vegetable crop in many tropical and subtropical parts of the world and is adaptable to wide range of growing conditions. It is a nutritious vegetable. It is a good source of vitamin A, B and also contains some amount of vitamin C. It is rich in protein, minerals and iodine.

Okra farming unlike other crop husbandry requires specialized type of farming techniques and skill. The success of any such enterprise depends upon participation of more and more farmers in it. Similarly extension workers have to play a more vital role to educate the farmers to take up okra production on their farms. The present study is therefore, an attempt to understand the level of adoption of okra growing farmers. This may help extension personnel in boosting Bhendi production by locating such farmers and by providing necessary facilities to them. With this specific idea in view, present investigation was undertaken with the following objectives to study the extent of adoption of recommended package of practices by okra growers and to identify the constraints encountered by okra growers in adoption of recommended cultivation practices of okra.

MATERIALS AND METHODS

The study was conducted in Parbhani district of Marathwada region of Maharashtra State. Parbhani and Purna talukas of Parbhani district were purposively selected for the present investigation because of more area under okra crop. From each taluka five villages were selected based on maximum acerage under okra crop. From each village 12 respondents were selected who were growing okra crop from last three years. Thus, 120 respondents growing okra crop constituted the sample for study. The data were collected through personal interview. The adoption of okra growers in respect of recommended improved cultivation practices of okra was studied by computing adoption score. Two score were assigned for full adoption, one score for partial adoption and zero score for non-adoption. The level of adoption was worked out by adding the score of adoption of all cultivation practices.

RESULTS AND DISCUSSION

From Table 1 it was revealed that 78.33 per cent of the respondents had adopted medium to rich fertile, deep,

| | solution | | • | | | | | | |

Patil (1998) and Waghmode (2005).

Data presented in Table 3 revealed that, major problem faced by the respondents in adoption of recommended practices of okra was failure of electric supply (100 per cent), followed by lack of knowledge of correct proportion of insecticidal solution, 76.66 per cent of the respondents felt constraints of lack of knowledge about recommended doses of insecticide, while 73.33 per cent of them had the constraint of more charges for labours.

Implications :

From the present investigation, following implications are drawn for the administrators, policy makers, extension workers and scientists which may help them to accelerate the adoption of recommended cultivation practices by okra growers.

- It was observed in the present study that majority of the okra growers had medium adoption level with respect to cultivation practices of okra. This implies that for enhancing adoption level, they should have also a high level of skill to avoid the difficulty in actual use of the practices. Hence, it is suggested that an organized programme in okra cultivation, trainings, demonstrations and frequent field visits should be taken up by the concerned extension agency so that adoption level of recommended cultivation technology of okra amongst farmers is enhanced.

- The respondents expressed the problem of irregular electric supply, non-availability of loan, nonavailability of chemical fertilizers in time, high rates of fertilizers and insecticides. They also face the problem of genuine seed material, non-availability of labours for intercultivation practices etc. Therefore, to overcome all these problems it is suggested that Government should undertake supply of genuine or certified seed material through agricultural university or other government institutes at proper time and at cheaper rate. It is also suggested that farmers may follow co-operative selling system to sell the crop produce.
